10. Major equipments installed in the Department/ Unit:

Name of equipment/faculty	A brief description	Uses
Animal Monitoring System	Animal monitoring systems are necessary tools for analyzing behavioral and physiological responses to experimental conditions.	To determine the effect of drugs on motor coordination or fatigue, respiration, blood flow, and blood oxygen of rodents can be monitored.
Rotarod (ROTA ROD)	The rotarod consists of a circular rod turning at a constant or increasing speed. Animals placed on the rotating rod try to remain on it rather than fall onto a platform some 30 cm below.	Rotarod test is widely used to evaluate drug effects on motor coordination, balance and motor learning in rodents. The principle of this test is that rats or mice are first trained to walk on a rod rotating at a certain speed.
NIBP	The NIBP module measures the oscillometric pulses transmitted through the blood pressure cuff and hose, and calculates the blood pressure measurements accordingly.	Intermittent mouse and rat blood pressure measurement based on the periodic occlusion of tail blood flow.
